

SONET/ATM ANALYZER

MP1555A

NEW

GPIB
OPTION

The MP1555A is a portable analyzer designed specifically for troubleshooting SONET, DSn, and ATM network construction and maintenance as well as for evaluating equipment for these networks. Various systems can be configured according to the application using plug-in units.

The MP1555A has two basic slots and three application slots. North American, CEPT, and Japanese systems can be analyzed by installing interface units into the basic slots. In addition, when two interface units are installed at the same time, the analyzer can perform international mapping. ATM and Jitter/Wander tests can be performed by installing application plug-in units in the three other slots.

The analyzer has a built-in printer and 3.5 inch floppy disk drive as standard. The measurement results can either be printed out or the data can be saved directly to the FDD for reading with an external personal computer. Furthermore, the FDD can be used to upgrade the analyzer firmware, making compliance with the latest Bellcore and ITU-T specifications easy.

Feature

- For SONET, DSn, and ATM network construction and maintenance

Performance and functions

• Simple operation

The pop-up menus permit item selection at a glance so even a novice can use the MP1555A immediately. In addition, the auto setup function enables automatic line mapping and easy line evaluation.

• DSn/SONET full analysis functions

An optical power meter is built-in, permitting optical power measurement while measuring alarms and errors with no need to switch optical fiber connections (Photo A).

Any TOH (1 byte) or K1/K2 byte can be captured in 64 frames for both error/alarm analysis and APS operation confirmation (Photo B). Measured errors/alarms can be displayed as a graph, and 1 second, 1 minute, 15 minutes, and 60 minutes can be set as the bar graph time units (Photo C).

• **Jitter and wander automatic measurement**

Jitter tolerance, jitter transfer, and jitter frequency can all be measured automatically. And since the data can be saved to floppy disk in the text format, data management is made simple by using a personal computer.

Masks conforming to Bellcore 499/253 and ITU-T Rec. G.823/G.824/G.825/G.958 standards are provided as preset data. Measurement is performed simply by pressing the start key. Furthermore, the operator can also set any other mask as necessary.

• **Simultaneous monitoring of 1023 channel cells and non-conforming cells**

The VPI/VCI for 1023 channels can be detected automatically, and the presence/absence of alarms, ATM cell count, and non-conforming cell count can be displayed graphically for easy comparison of line channel traffic.

SDH/PDH/ATM ANALYZER

MP1552A

NEW

GPIB
OPTION

The MP1552A is a portable analyzer designed specifically for troubleshooting SDH, PDH, and ATM network construction and maintenance as well as for evaluating equipment for these networks. Various systems can be configured according to the application using plug-in units.

The MP1552A has two basic slots and three application slots. CEPT, North American, and Japanese systems can be analyzed by installing interface units into the basic slots. In addition, when two interface units are installed at the same time, the analyzer can perform international mapping. ATM and Jitter/Wander tests can be performed by installing application plug-in units in the three other slots.

The analyzer has a built-in printer and 3.5 inch floppy disk drive as standard. The measurement results can be printed out or the data can be saved directly to the FDD for reading with an external personal computer. Furthermore, the FDD can be used to upgrade the analyzer firmware, making compliance with the latest ITU-T specifications easy.

Feature

- For SDH, PDH, and ATM network construction and maintenance

Performance and functions

• Simple operation

The pop-up menus permit item selection at a glance, so even a novice can use the MP1552A immediately. In addition, the auto set-up function enables automatic line mapping and easy line evaluation.

• PDH/SDH full analysis functions

An optical power meter is built-in, permitting optical power measurement while measuring alarms and errors with no need to switch optical fiber connections (Photo A).

Any SOH (1 byte) or K1/K2 byte can be captured in 64 frames for both error/alarm analysis and APS operation confirmation (Photo B). Measured errors/alarms can be displayed as a graph, and 1 second, 1 minute, 15 minutes, and 60 minutes can be set as the bar graph time units (Photo C).

● Jitter and wander automatic measurement

Jitter tolerance, jitter transfer, and jitter frequency can all be measured automatically. And since the data can be saved to floppy disk in the text format, data management is made simple by using a personal computer.

Masks conforming to ITU-T Rec. G.823/G.824/G.825/G.958 standards are provided as preset data. Measurement is performed simply by pressing the start key. Furthermore, the operator can also set any other mask as necessary.
